@bbenz

Developer Experiences

Monitor - logstream, APM, & end-to-end

Identities - end users and machines

Automation

Azure Container Apps

Open-source client libraries, integration modules, and drivers

Data

AI

Storage

Cache

Async communications - JMS and Kafka

Keys, secrets, and certs

Use case

- Python Interpreter
- Custom Container
- Temporary environments that need isolation and quick startup performance
 - Isolation: For arbitrary/untrusted code execution (e.g. LLM or user-defined scripts)
 - Speed: For brief executions

Sample User scenarios

AI Chats

Prompt testing

Transient processing

Remote builds

Cloud shells

User-facing components

Session pool

Sessions

Session pool

- Resource type that sessions will run in
 - Microsoft.App/sessionPools
- Defines the container to run in sessions. Either:
 - Python interpreter (platform-managed)
 - Custom container
- If custom container: create the Session pool resource in a Container App Environment

Session pool settings

Max # of sessions (scale out max)

Cooldown period (scale in): any statefulness is lost after this idle period

Secrets

Session

Represents an execution, not a resource type

Invoke via API for each execution

Can preserve state between executions with same token id (until cooldown)

Session invocation – code

- **Format:** POST
`https://<region>.acasessions.io/subscriptions/<subId>/resourceGroups/<rg>/sessionPools/<sessionname>/python/execute?identifier=myArbitrarySession1`
- **Body:**

```
{  
  "properties": {  
    "codeInputType": "inline",  
    "executionType": "synchronous",  
    "pythonCode": "x=1;print(x);import  
time;time.sleep(1)",  
    "timeoutInSeconds": 100  
  }  
}
```

Session invocation – authentication

Get an Azure token (e.g. via Managed Identity, Entra app, etc)

Azure ContainerApps Session Creator

Audience claim (aud):
<https://dynamicsessions.io>

Authentication: Bearer *<token>*

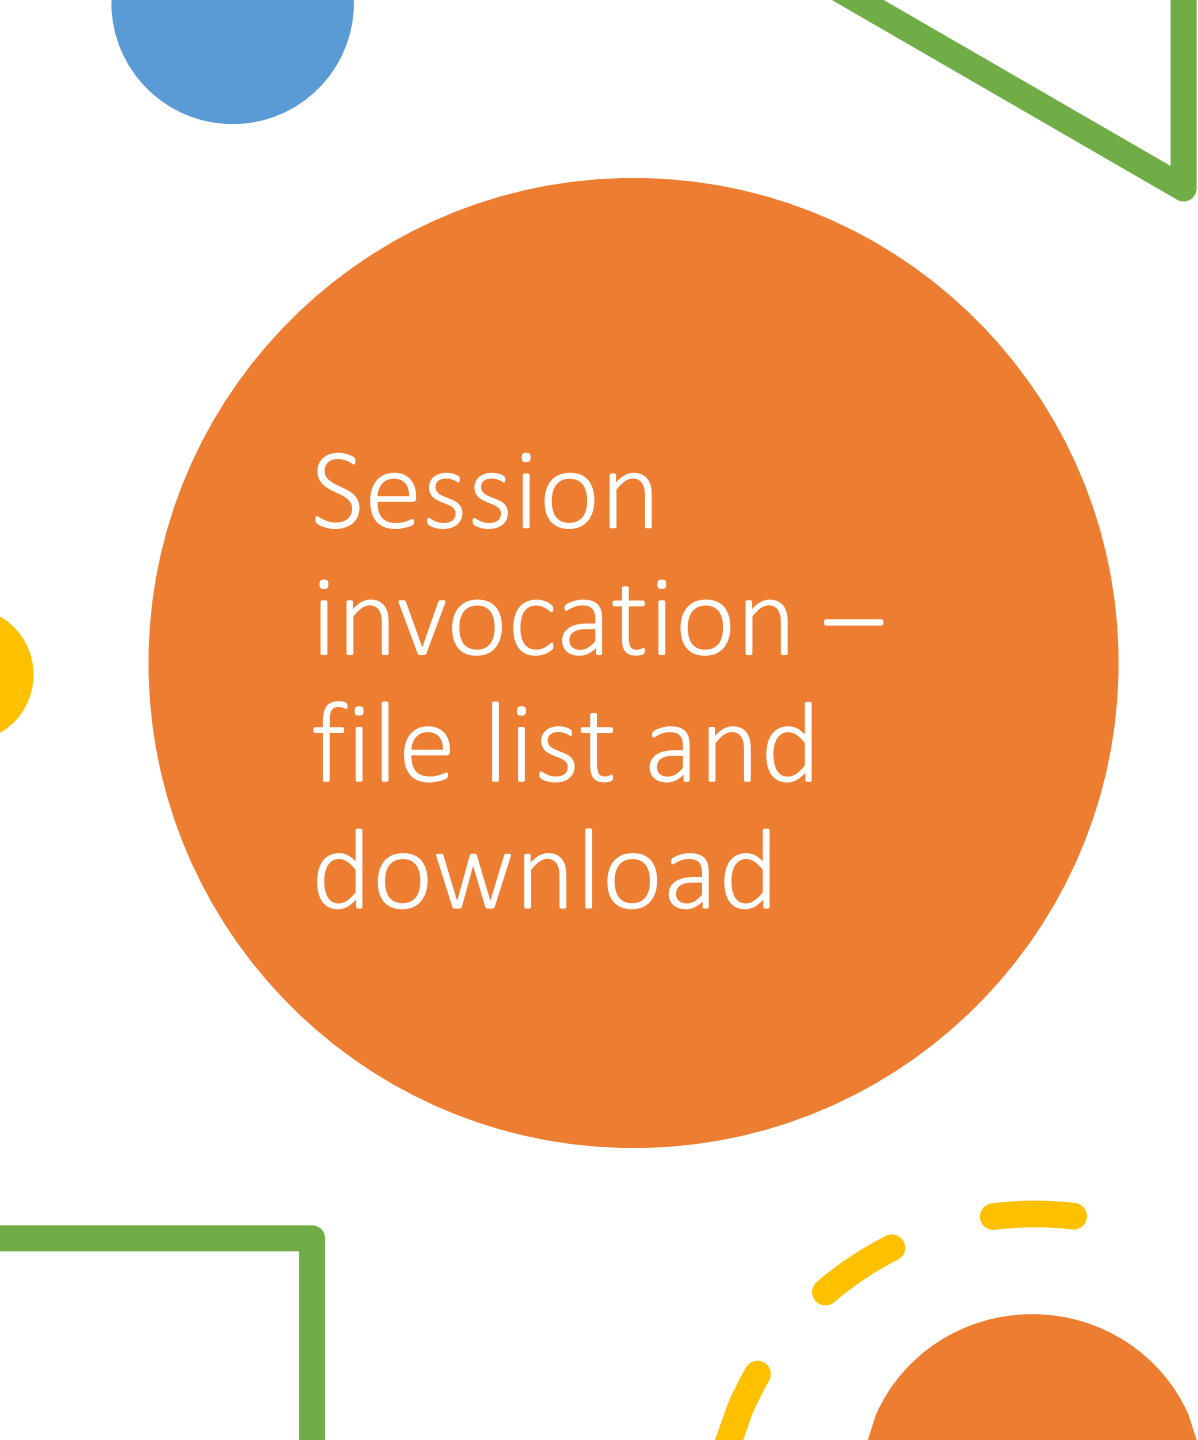

Session invocation – upload file

- **Format:**

POST https://<region>.dynamicsessions.io/subscriptions/<subId>/resourceGroups/<rg>/sessionPools/<sessionname>/python/**uploadFile**?identifier=myArbitrarySession1

- **Body:**

```
{  
  "file": <binary>  
}
```

Session invocation – file list and download

- **List:**

GET `https://<region>
>.dynamicsessions.io
/subscriptions/<subId>/resourceGroups/<rg>/sessionPools/<sessionname>
/python/list?identifier=myAbitrarySession1`

- **Download:**

GET
`https://<region>.dynamicsessions.io
/subscriptions/<subId>/resourceGroups/<rg>/sessionPools/<sessionname>
/python/downloadFile?identifier=myAbitrarySession1&fileName=myFile.txt`
